

# FROM THE DESERT INTO THE SAVANNAH A TREK ACROSS THE EXO-NEPTUNES LANDSCAPE

Vincent Bourrier & the SPICE DUNE team

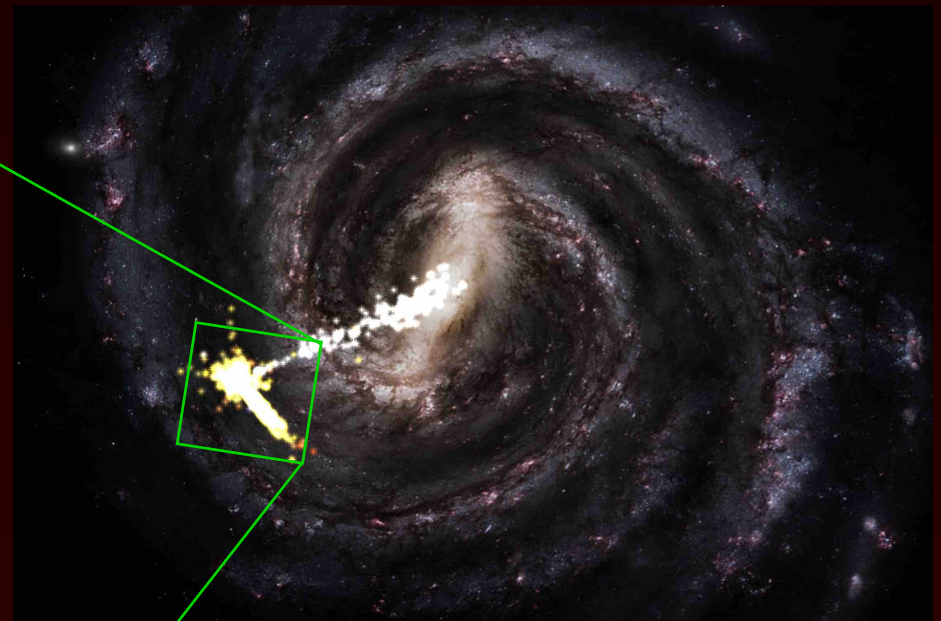

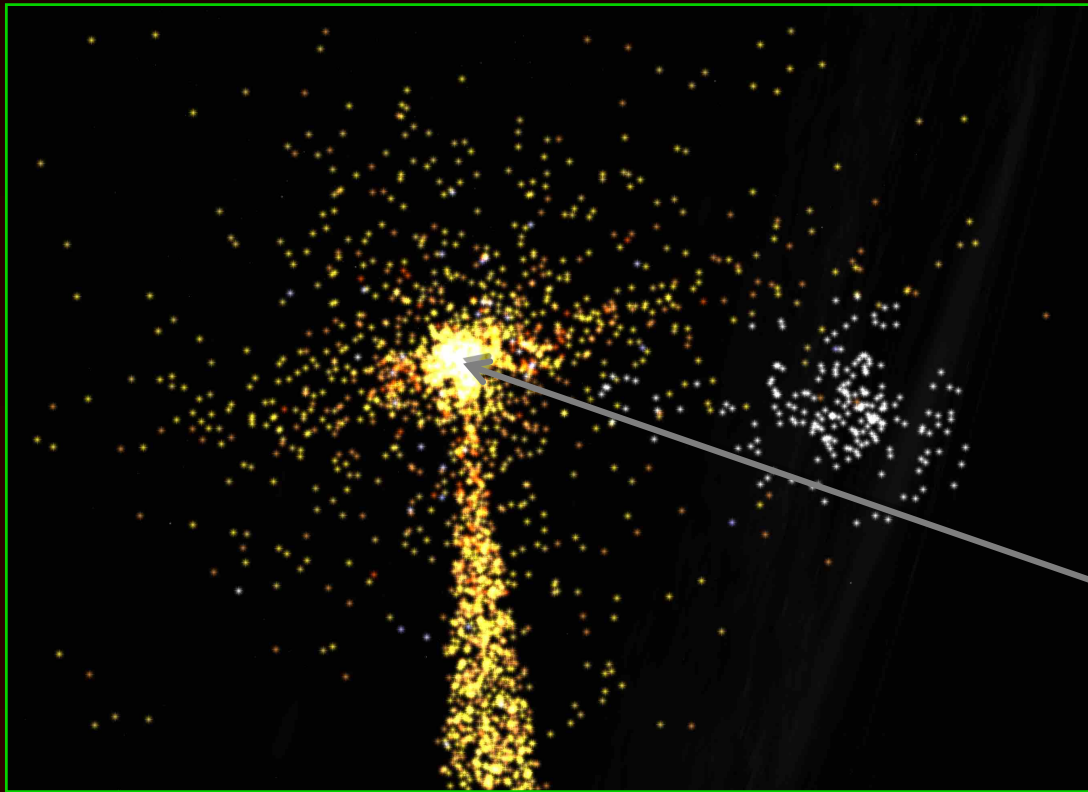

Lagrangre Seminar (OCA) – 9 Jan. 2024

# Prologue

# THE (KNOWN) EXOPLANET POPULATION

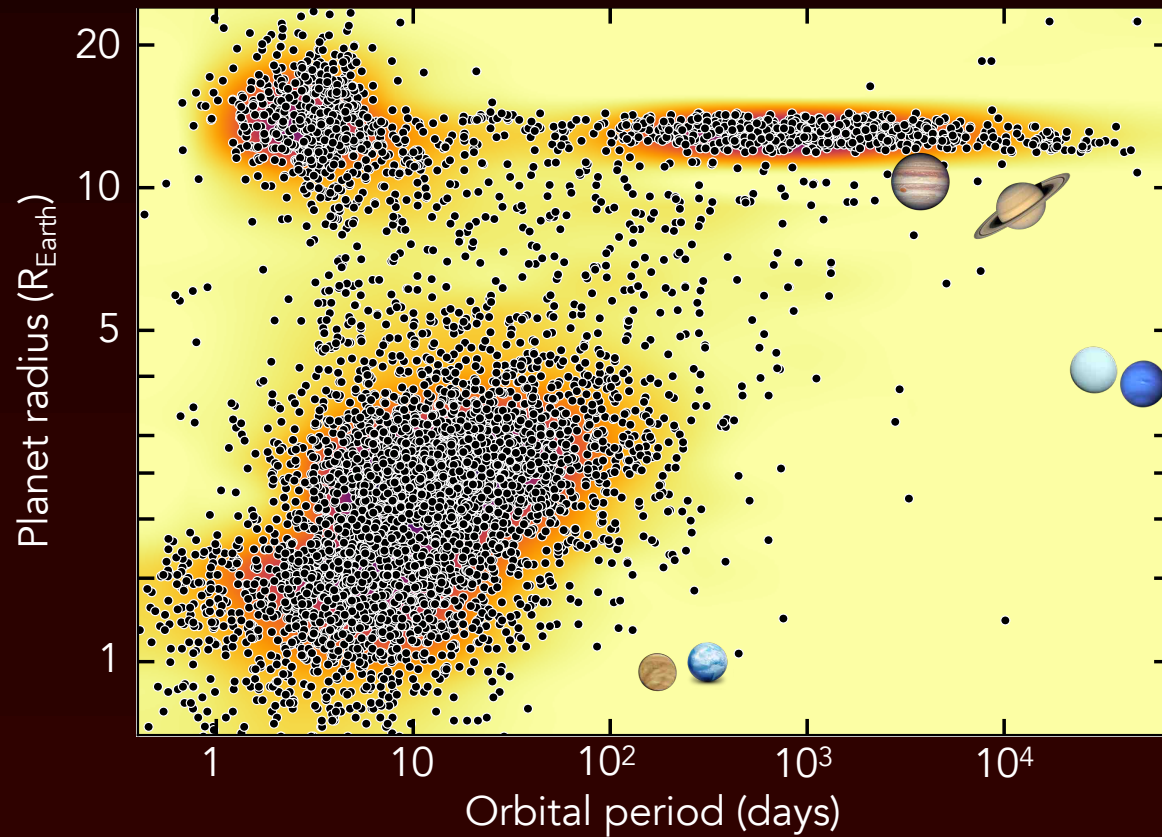

~ 5600 exoplanets in Jan. 2024

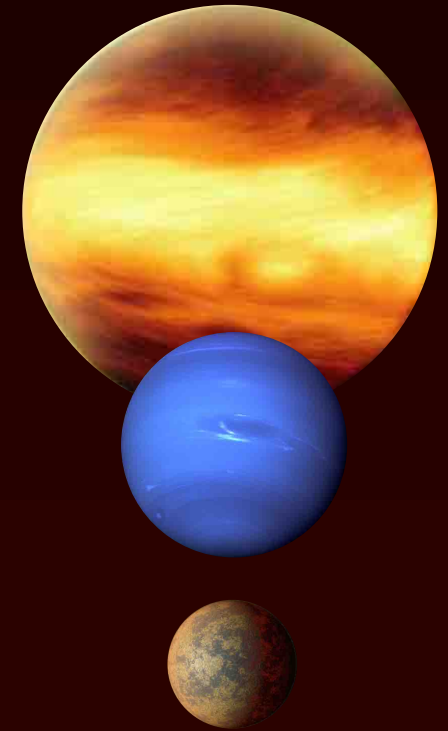

Solar System

*Credit: Eyes on Exoplanet (NASA)*

# A DIVERSE POPULATION

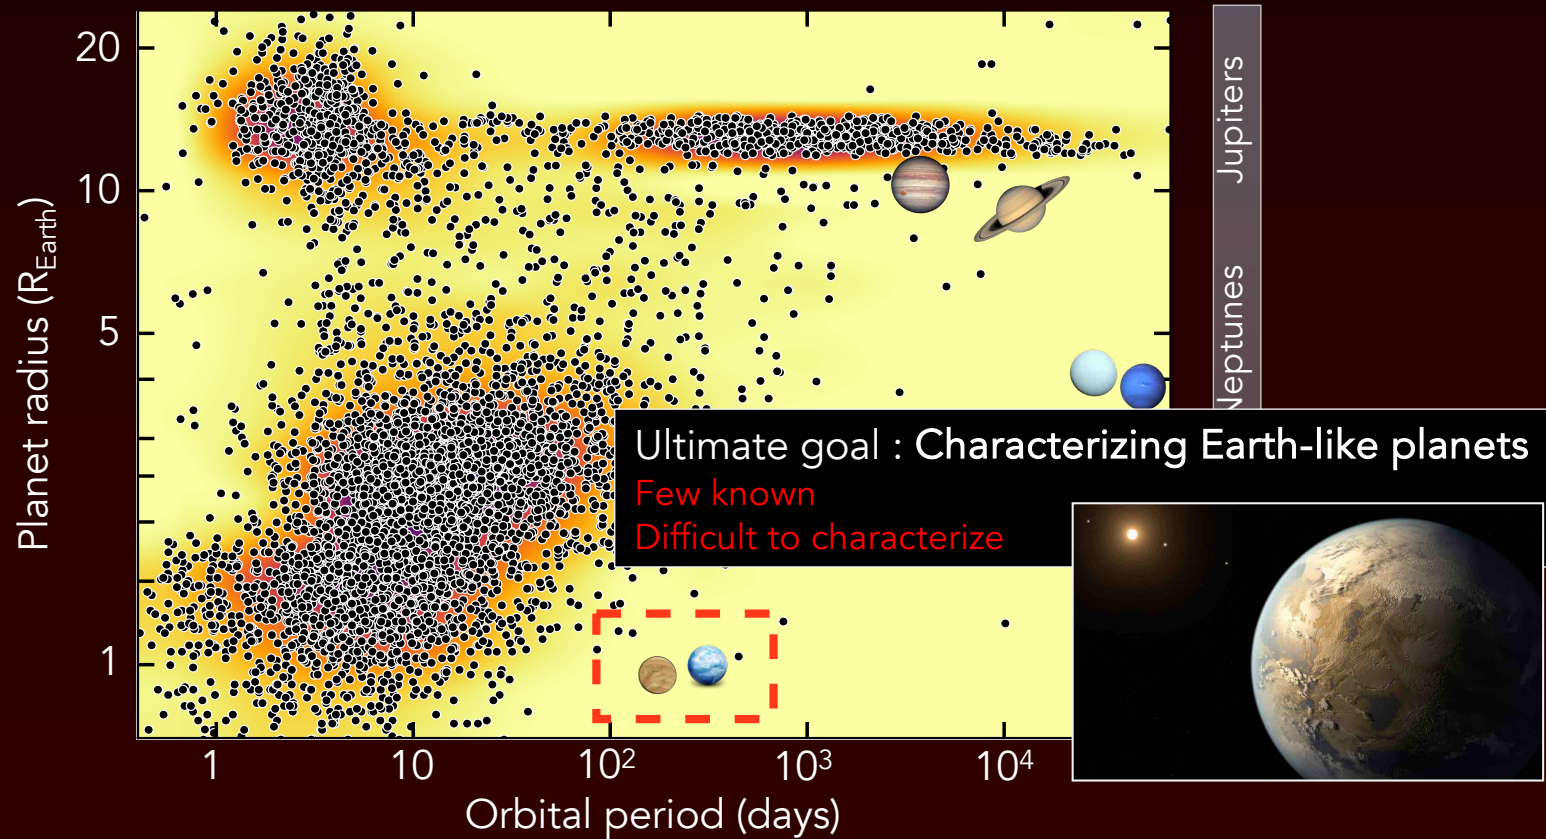

Rocky planets  
Neptunes  
Jupiters

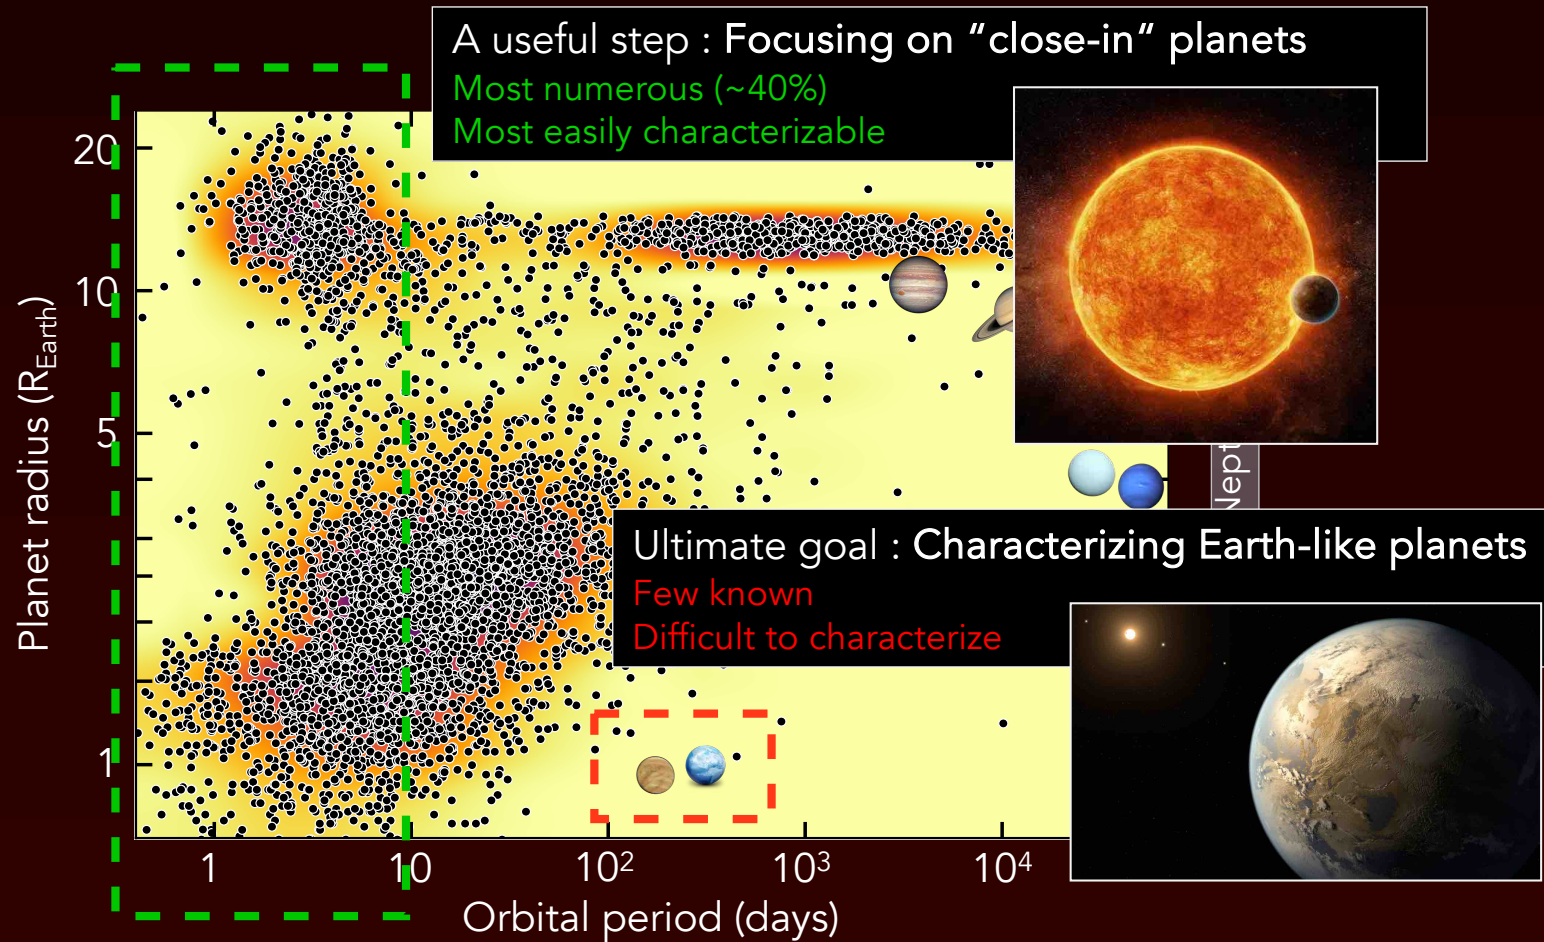

Data from [exoplanets.eu](http://exoplanets.eu) & NASA exoplanet archive

# A DIVERSE POPULATION

# A DIVERSE POPULATION

# CLOSE-IN PLANETS

## The Neptunian desert

e.g. Lecavelier des Etangs 2007,  
Penz+2008, Davis & Wheatley  
2009, Ehrenreich & Desert 2011,  
Beaugé & Nesvorný 2013,  
Lundkvist+2016, Mazeh+2016

Marker of formation and  
evolution processes

# ORIGINS OF THE DESERT ?

e.g. Lopez+2012, Jin+2014, Kurokawa+2014, Owen+2017

Relative roles ?

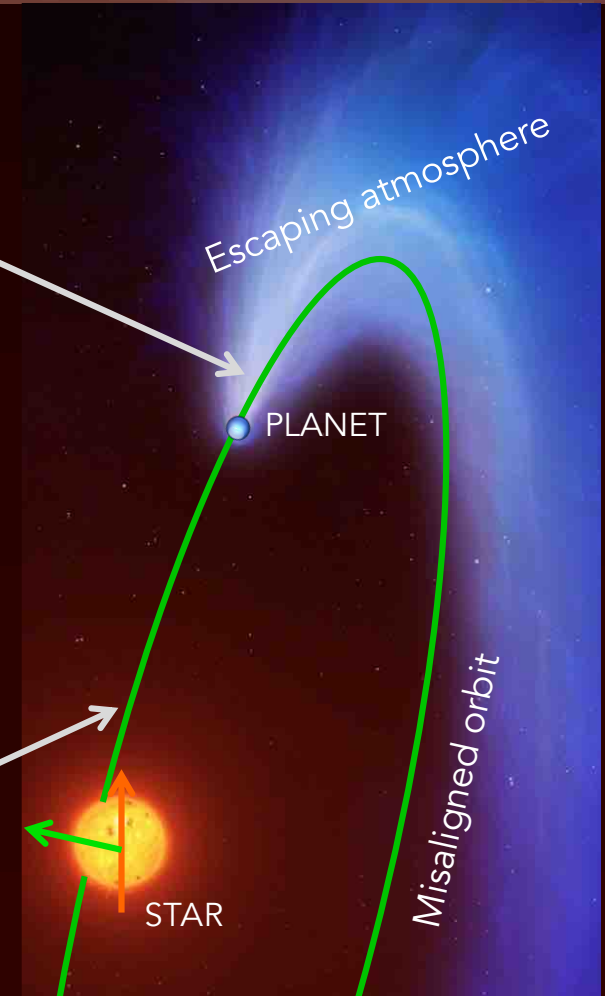

Not enough data

**Migration** traced by **orbital architecture**

e.g. Mazeh+2016, Bourrier+2018

See review by Owen+2018

Credit: Mark Garlick/University of Warwick

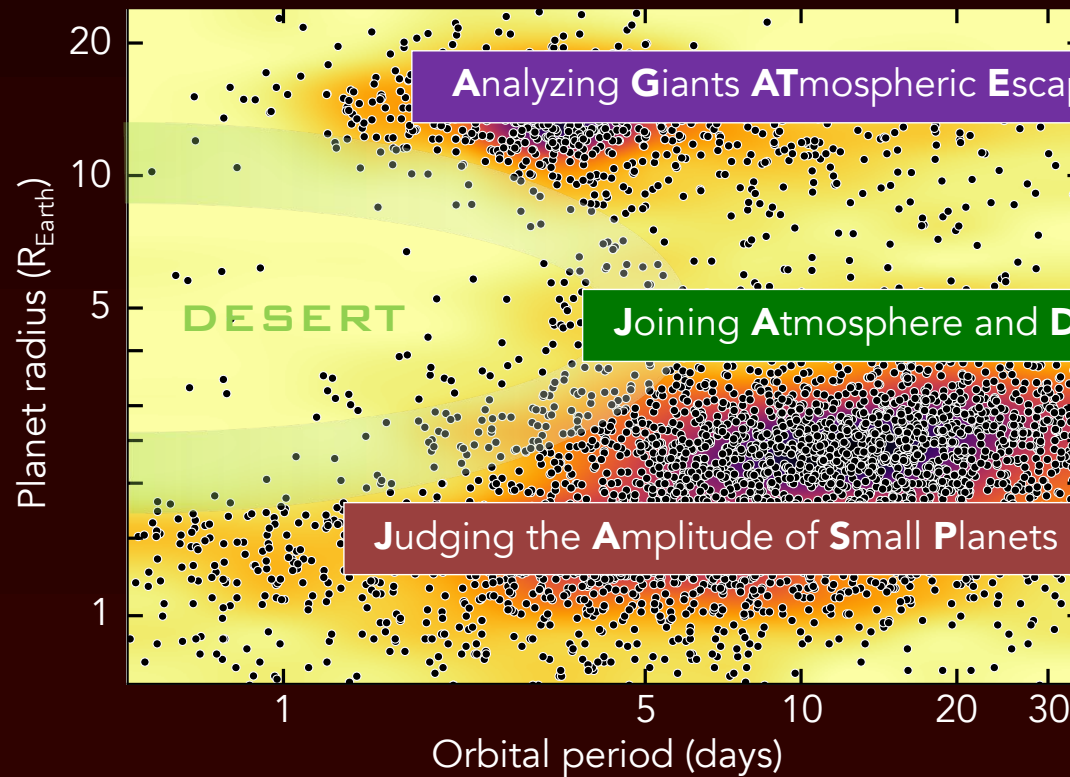

# SPECTRO PHOTOMETRIC INQUIRY OF CLOSE-IN EXOPLANETS AROUND THE DESERT TO UNDERSTAND THEIR NATURE AND EVOLUTION

**Objectives:** Understanding the origins of the desert to unveil the history of close-in planets

**Approach:** Gathering mass loss and architecture measurements to inform atmospheric and evolutionary models

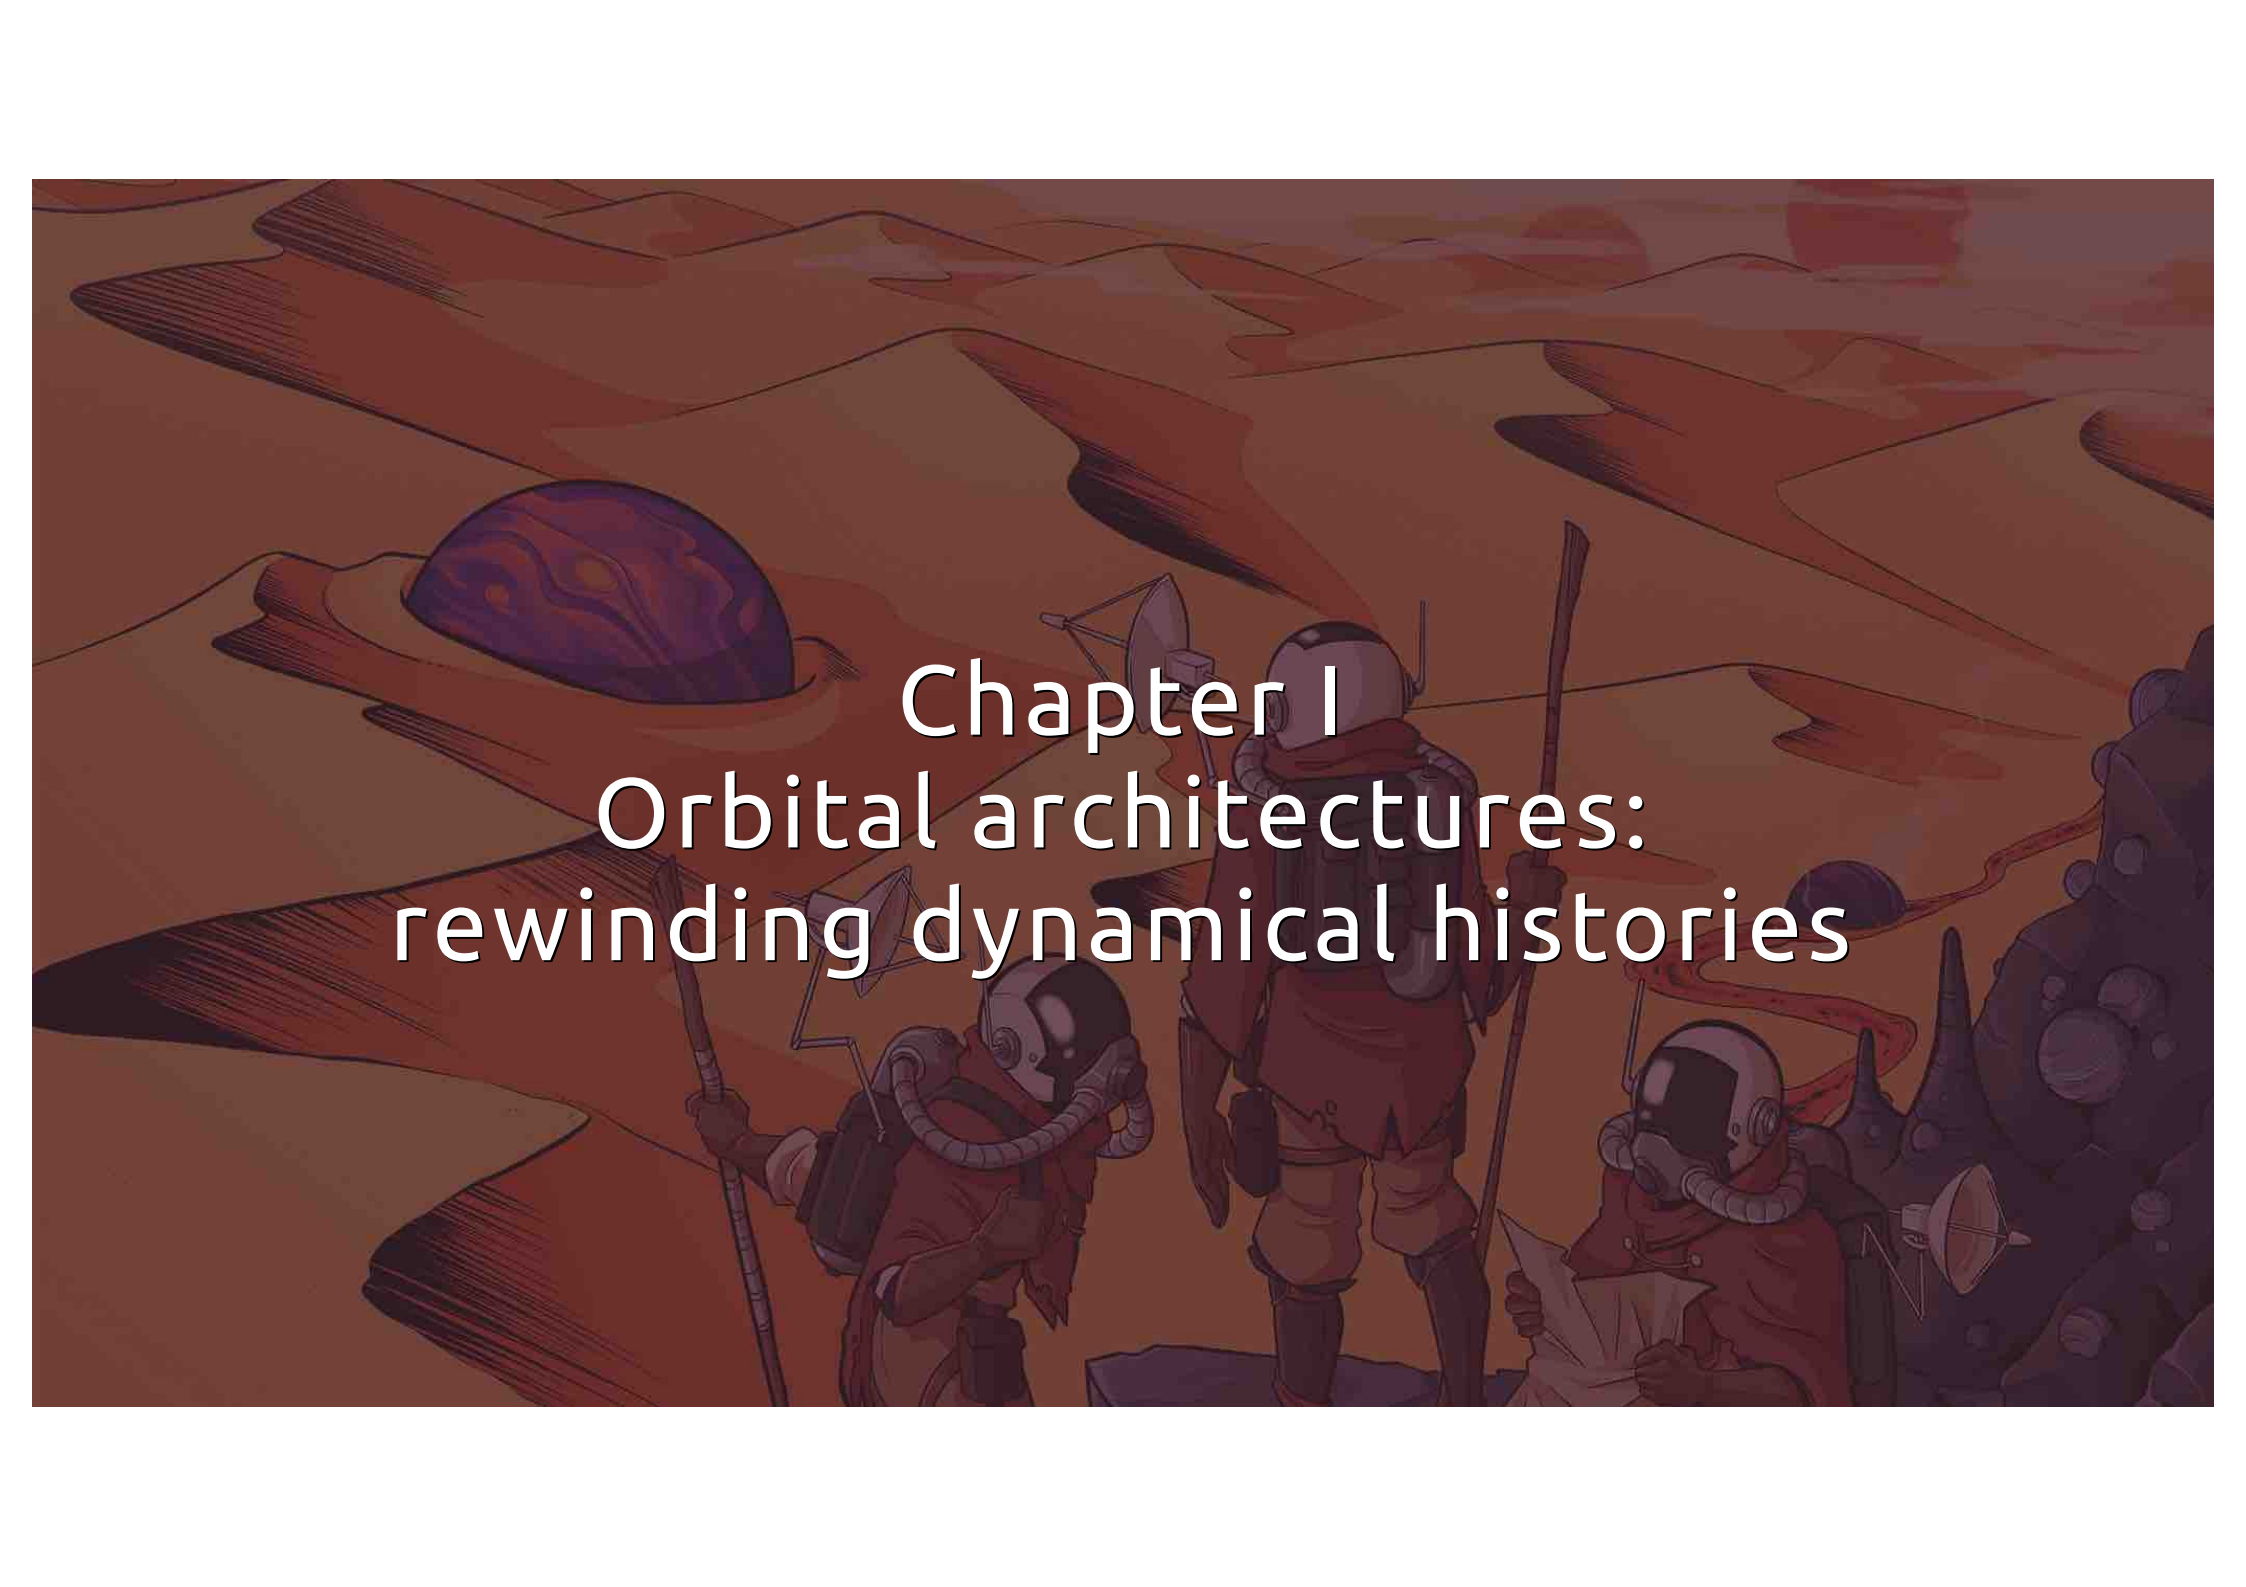

AGATE

JASPER

Chapter I  
Orbital architectures:  
rewinding dynamical histories

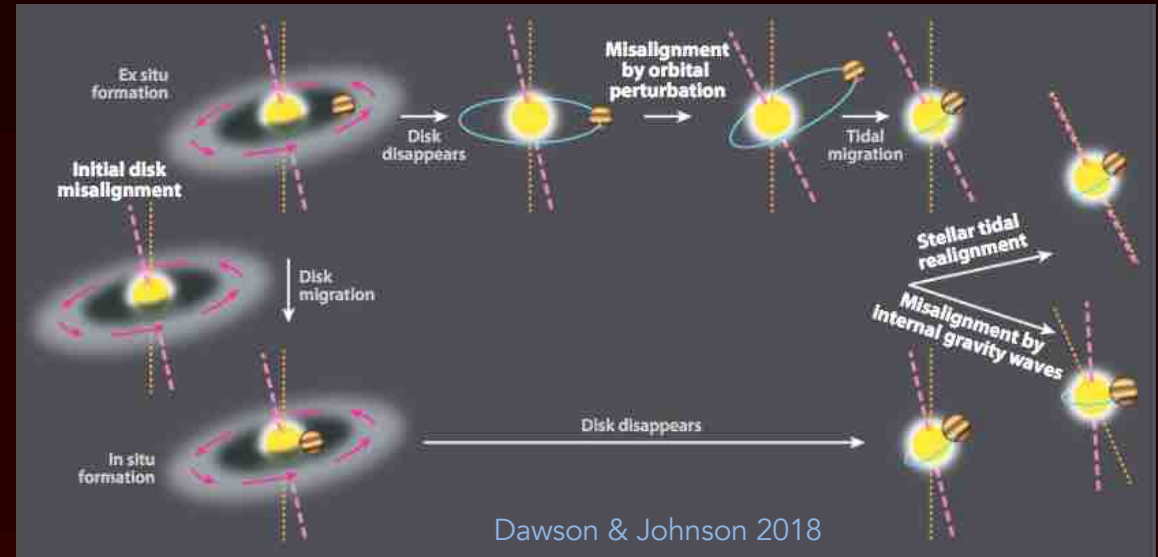

# DYNAMICAL HISTORIES

Alignment inherited from gas cloud collapse

(Possible) moderate primordial misalignment

- From the protoplanetary disk (Batygin 2012, Lai 2014)
- From the star
  - chaotic formation (Bate+2010, Fielding+2015)
  - internal gravity waves (Rogers+2012)
  - magnetic torques (Lai+2011)
  - gravitational torques (Tremaine 1991, Storch+2014)

Evolution of orbital architecture via two main migration processes

- Primordial orientation maintained by disk-driven migration (Lin+1996, Baruteau+2016)
- Primordial orientation lost and large misalignment induced by high-eccentricity migration
  - planet-planet scattering (Ford+2008, Nagasawa+2008)
  - Kozai-lidov migration (Fabrycky+2007, Naoz+2011)
  - secular chaos (Wu+Lithwick 2011)

Variety of present-day orbital architectures and spin-orbit angles

# DREAM I. ORBITAL ARCHITECTURE ORRERY

The **D**esert- **R**im **E**xoplanets **A**tmosphere and **M**igration program

Survey of 14 transiting planets at the borders of the desert with HARPS, HARPS-N, CARMENES

Homogeneous analyses to measure spin-orbit angles and atmospheric signatures

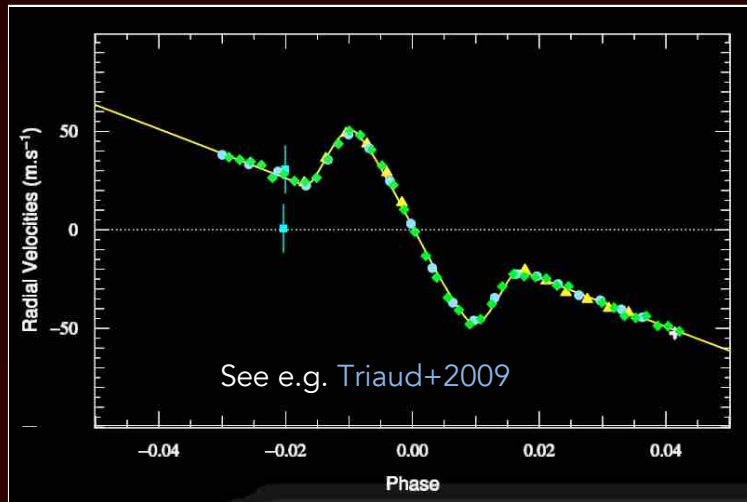

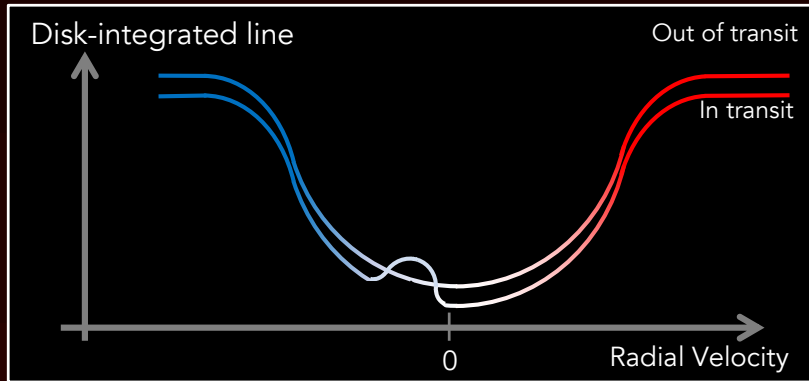

**DREAM I** (Bourrier+2023)

Relative roles of disk-driven and late migration in shaping the desert ?

Are Neptune-size planets undergoing a different dynamical evolution ?

# RM EFFECT

## Velocimetric RM

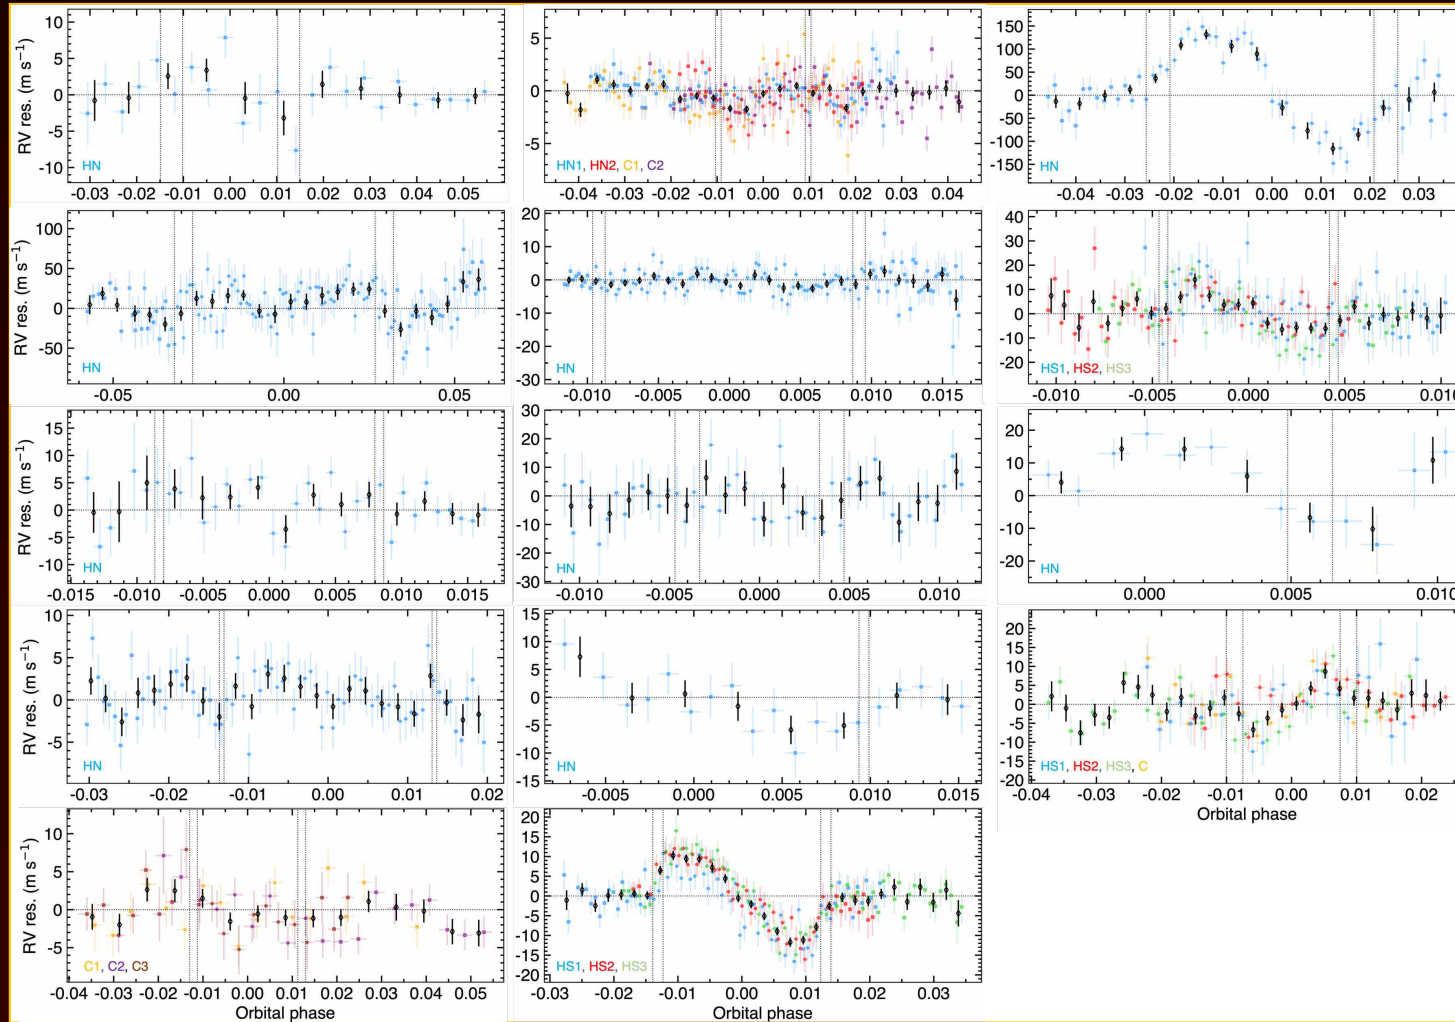

Merges star + planet information into a single anomalous measurement

Loss of signal (favors large planets and fast rotators) and possible biases

See e.g. Cegla+2016a

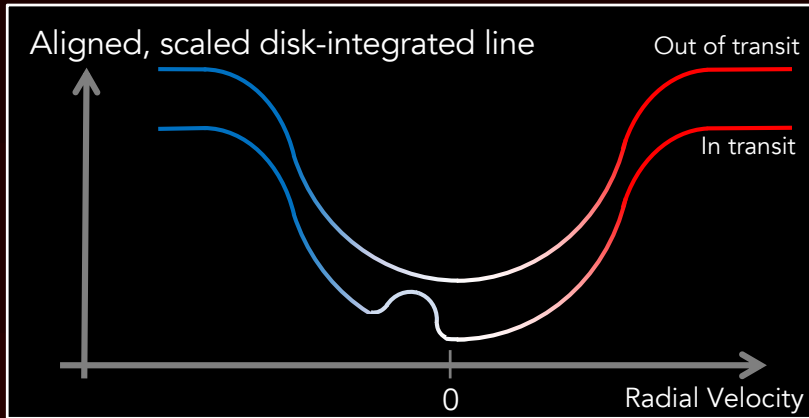

# DREAM I. ORBITAL ARCHITECTURE ORRERY

# RM EFFECT

Isolating **planet-occulted** lines

# RM EFFECT

Isolating **planet-occulted** lines

=

➤ **Reloaded RM** (Cegla+2016b): fitting stellar surface RVs when lines detectable in each exposure

➤ **RM Revolutions** (Bourrier+2021): fitting all planet-occulted lines together with global model

Exploits as much information as possible

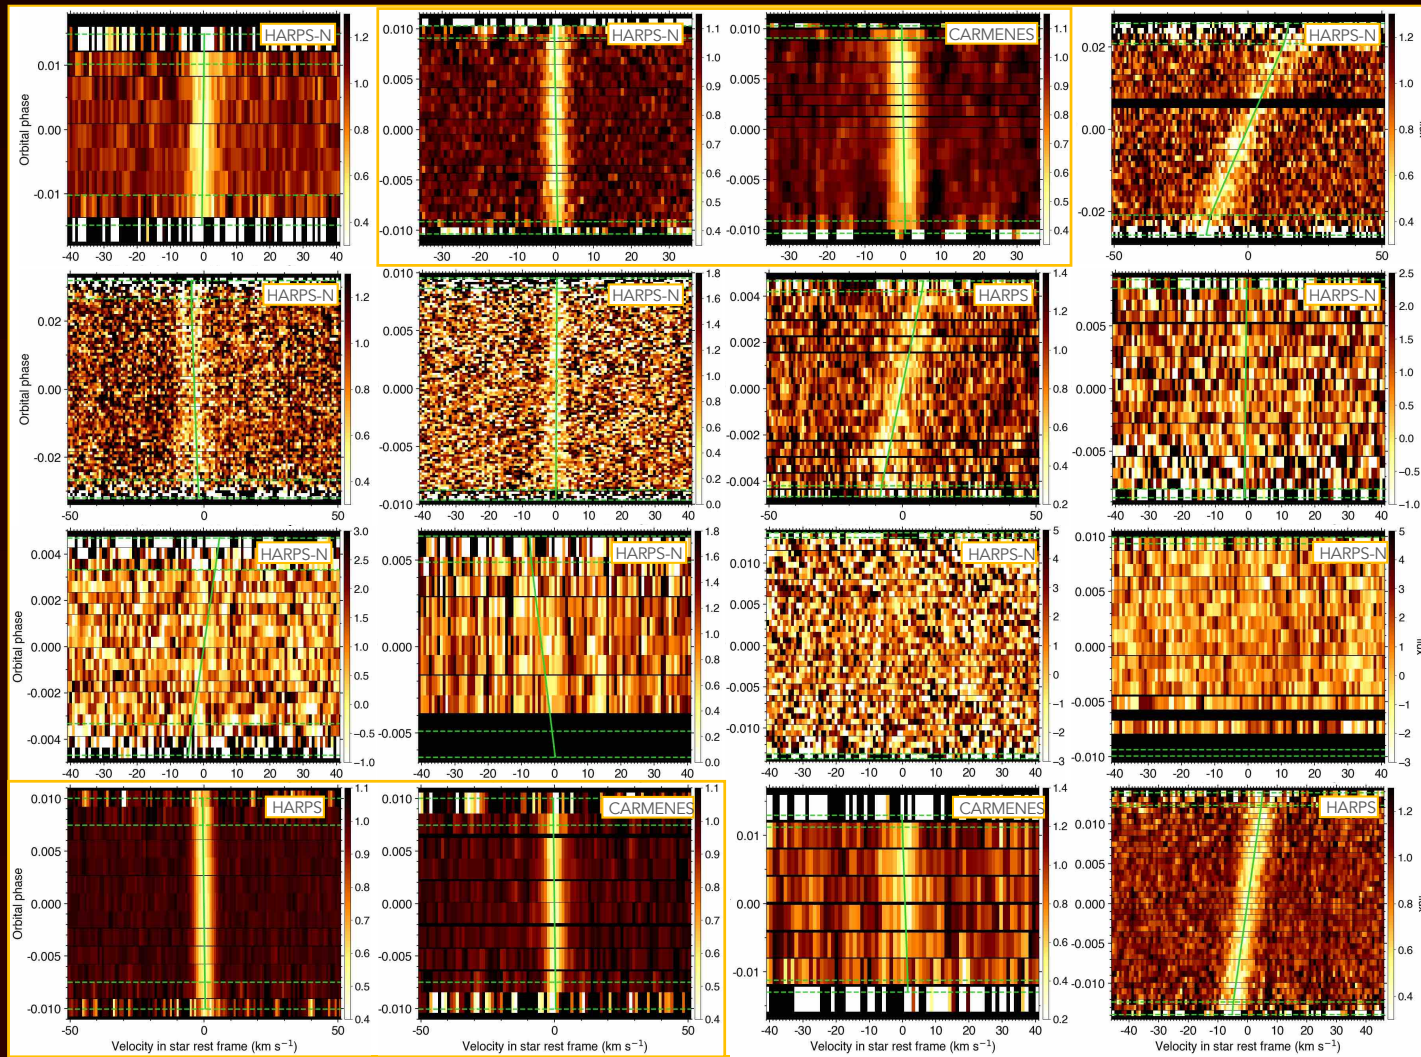

Accounts for variations in line position & line profile simultaneously

S/R boost : unlocks signal of small planets ( $< 2 R_E$ ) transiting faint stars

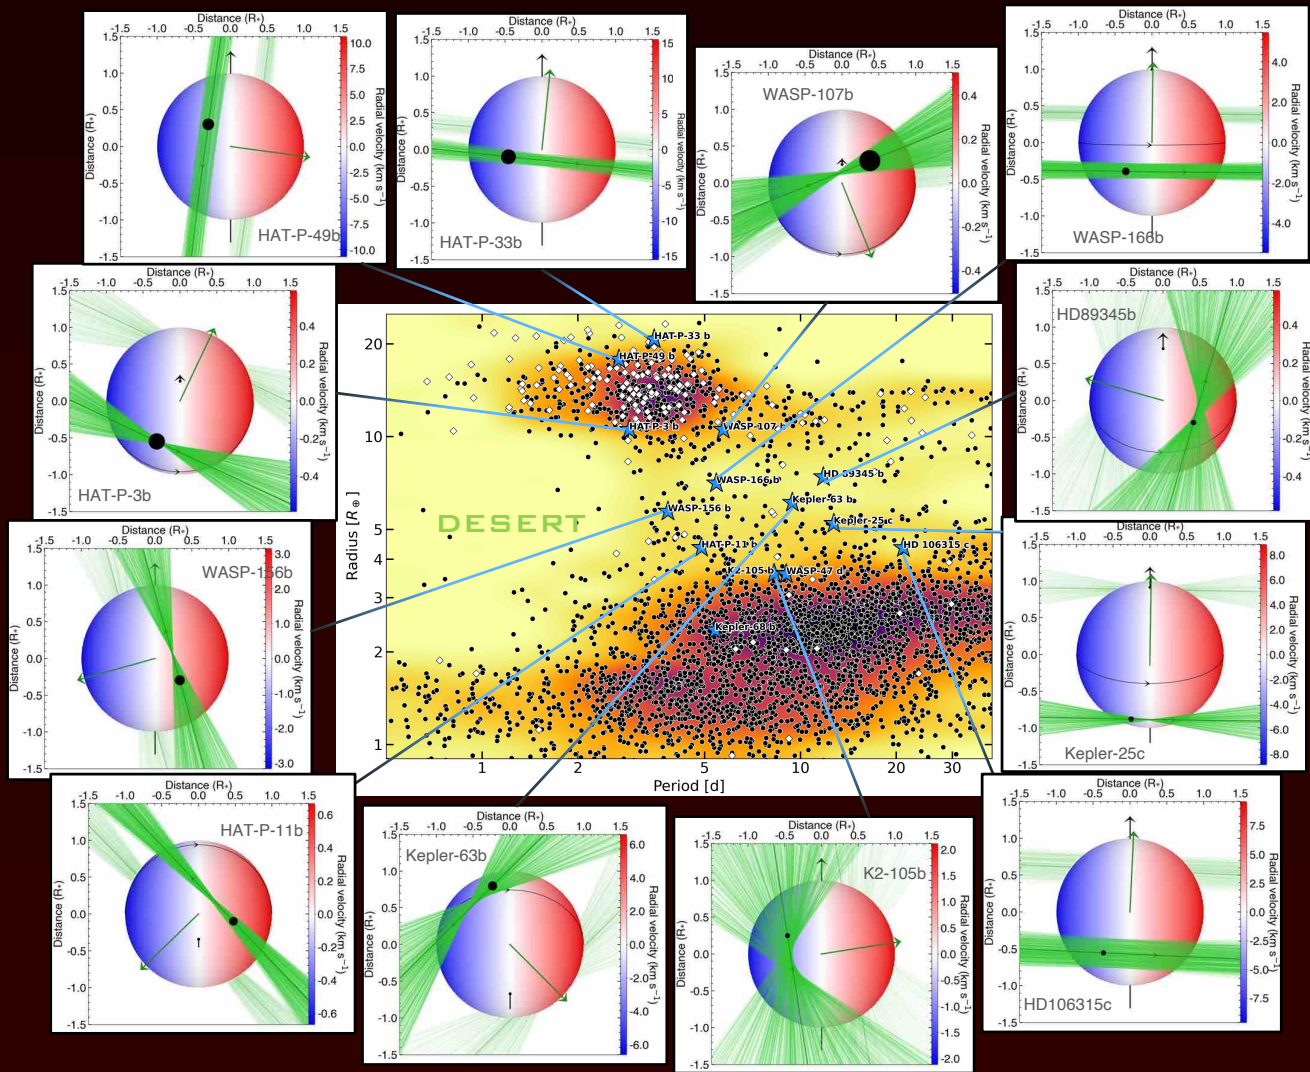

# DREAM I. ORBITAL ARCHITECTURE ORRERY

- 12 detections out of 14 planets
- 6 new spin-orbit angles
- 6 refined spin-orbit angles

# DREAM I. ORBITAL ARCHITECTURE ORRERY

Substantial addition to known obliquity sample, especially in the Neptune regime

High fraction of polar orbits, supporting the role of late migration in shaping the desert

An illustration of three astronauts in red spacesuits on a reddish, rocky planet surface. One astronaut is standing in the center, another is kneeling on the left holding a probe, and a third is kneeling on the right holding a map. A large purple planet is visible in the sky. The scene is set against a dark, reddish background with stylized clouds and a satellite dish on the right.

Chapter II  
Spin-orbit angles of close-in planets:  
the realm of tides

# SPIN-ORBIT ANGLES OF CLOSE-IN PLANETS

Need to study spin-orbit angles versus star / planet properties to disentangle dynamical processes

Possible trends with parameters that relate to tides raised in the star

see Winn+2010, Hebrard+2011, Triaud+2011, Albrecht+2012, Triaud+2018

More massive planets  
are more aligned

Planets around cooler  
stars are more aligned

Closer-in planets  
are more aligned

# DREAM II. UNDER THE LENS OF TIDES

**DREAM II** (Attia+2023)

Re-analysis of sky-projected spin-orbit angle distribution confirms trends with  $T_*$ ,  $M_p/M_*$ , and  $a_p/R_*$ .

Observational bias toward misaligned systems

Need for robust statistical framework to estimate stellar inclination  $i_*$  and 3D spin-orbit angle  $\psi$  (e.g. Crida+2014)

$$\cos \psi = \sin i_* \sin i_p \cos \lambda + \cos i_* \cos i_p,$$

Need for general tidal efficiency parameter to assess global influence of tides (inspired by Albrecht+2012)

$$\tau \equiv \frac{M_{\text{conv}}}{M_*} \left( \frac{M_p}{M_*} \right)^2 \left( \frac{a}{R_*} \right)^{-6}$$

# DREAM II. UNDER THE LENS OF TIDES

Formula to estimate misalignment probability

Unbiased sample of ~200 close-in planet 3D spin-orbit angles

Fraction of misaligned systems correlates linearly with tidal efficiency factor

Systems with negligible efficiency trace processes unaltered by tidal interactions

# DREAM II. UNDER THE LENS OF TIDES

"pristine" sample unaffected by tides

The desert and savannah may be preferentially populated by late dynamical migration.

Chapter III  
Helium: the new Eden  
of atmospheric escape

# PROBING ESCAPE

## Neutral hydrogen (FUV)

(Vidal-Madjar+2003, Lecavelier+2012, Ehrenreich+2015, ...)

- Probes exosphere
- Absorbed by interstellar medium
- No stellar continuum
- From space only

## Metastable helium (near-IR)

(Spake+2018, Allart+2019, Nortmann+2018, ...)

- Probes thermosphere and exosphere
- Not absorbed by interstellar medium
- Bright stellar continuum
- From ground and space

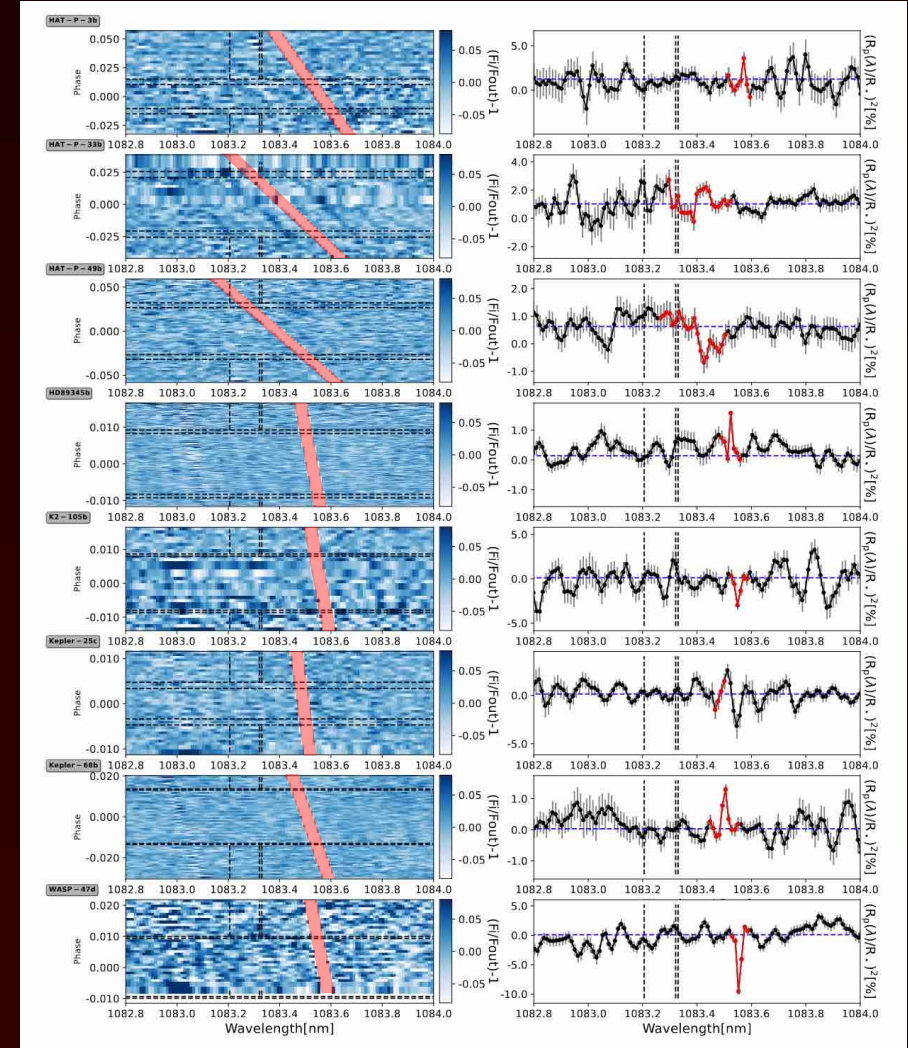

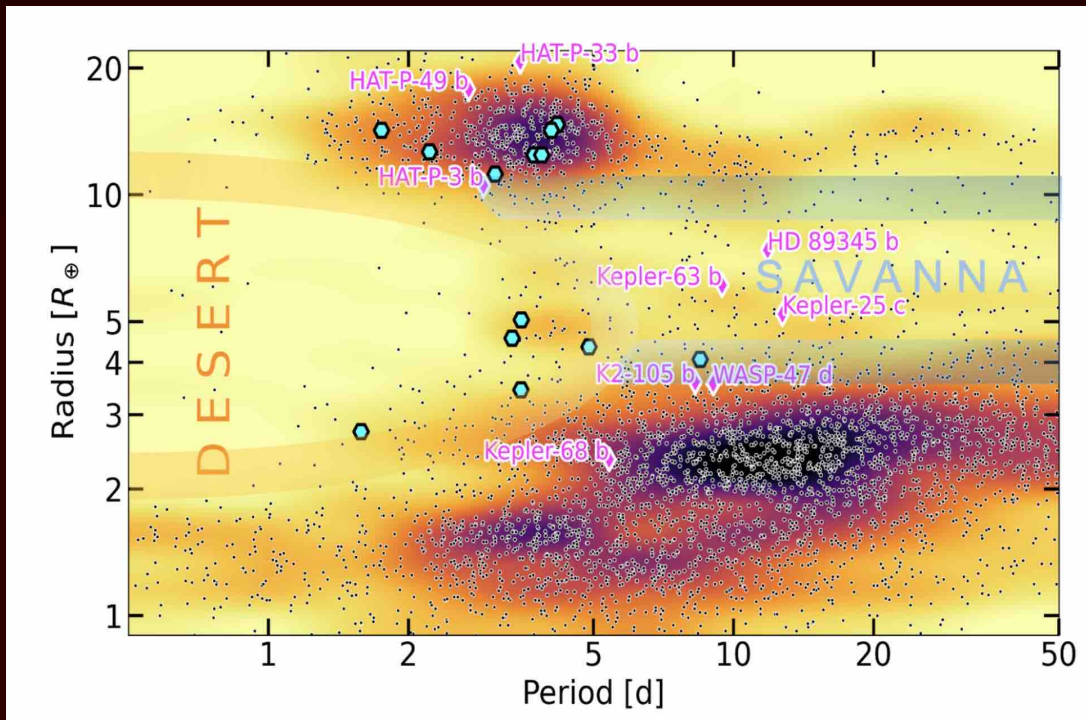

# DREAM III. A HELIUM SURVEY IN PLANETS ON THE EDGE

**DREAM III** (Guilluy+2023)

TNG/GIANO transit spectra of DREAM I sample

Same reduction as Allart+2023 sample

# DREAM III. A HELIUM SURVEY IN PLANETS ON THE EDGE

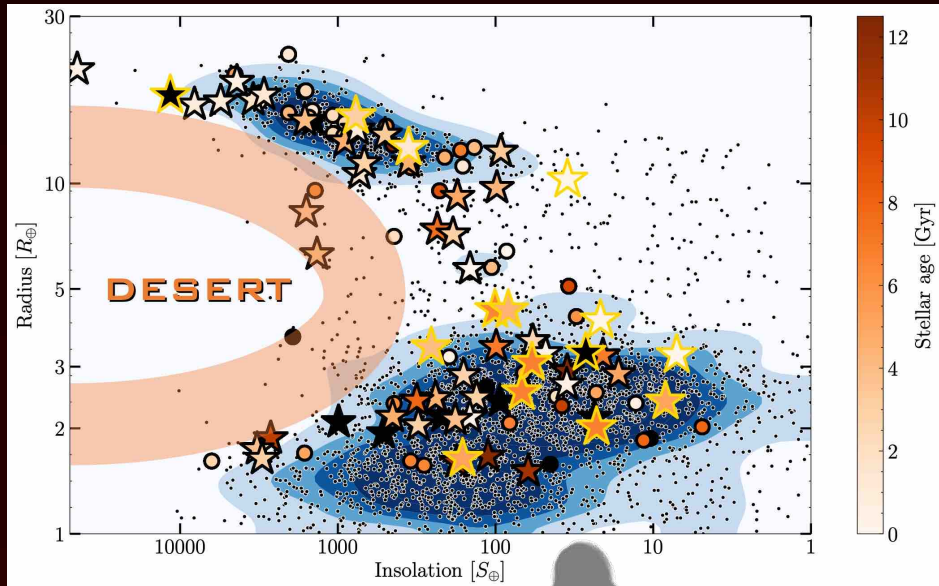

Upper limits on absorption, height, and mass loss

Supports correlation between stellar mass or XUV flux and He absorption, but not mass loss

Complex correlations : need for homogeneous surveys and analyses

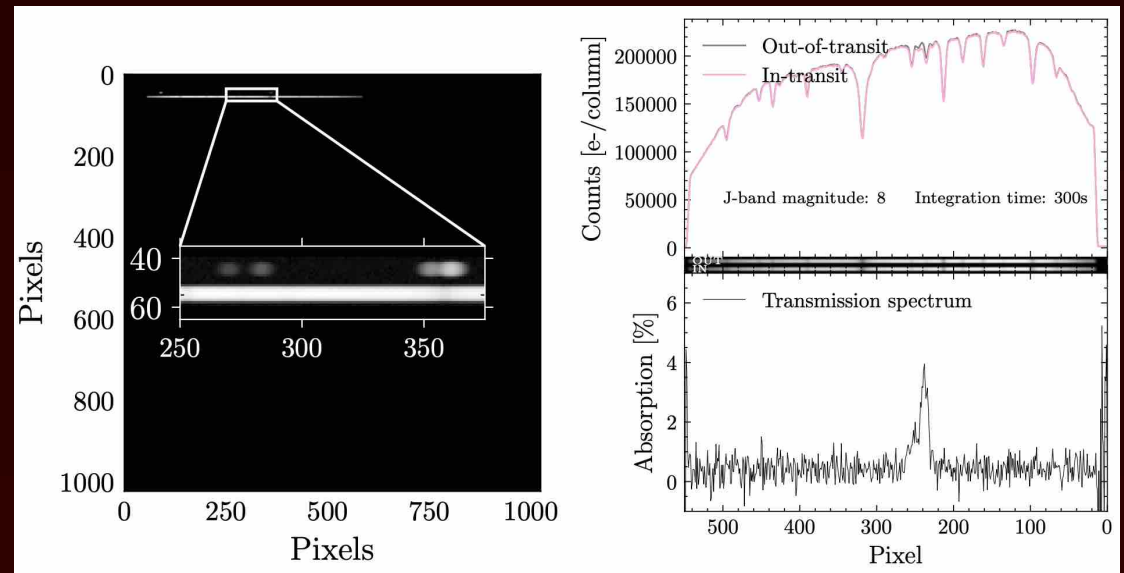

# NEAR-INFRARED GATHERER OF HELIUM TRANSITS

NIGHT: A compact, low-budget, high-resolution spectrograph to survey He in exoplanet systems

Credits: S. Bovay

See Farret Jentink+2023

Chapter IV  
EVE: origins of  
atmospheric escape

# 1D THERMOSPHERE

Use of *p-winds* (Dos-Santos+2022, based on Oklopčić & Hirata 2018) to constrain mass loss

- 1D code
- Parker wind approximation
- H/He chemistry
- Simplified radiative transfer

Simulation by Y. Carteret

# 1D THERMOSPHERE INTO 3D FRAMEWORK

Use of *EVE* (Bourrier+2013, 2016) to constrain mass loss

- 3D code
- Spatially & spectrally-resolved stellar grid
- Thermosphere (1D p-winds profiles)
- Simulates spectra as observed with instruments

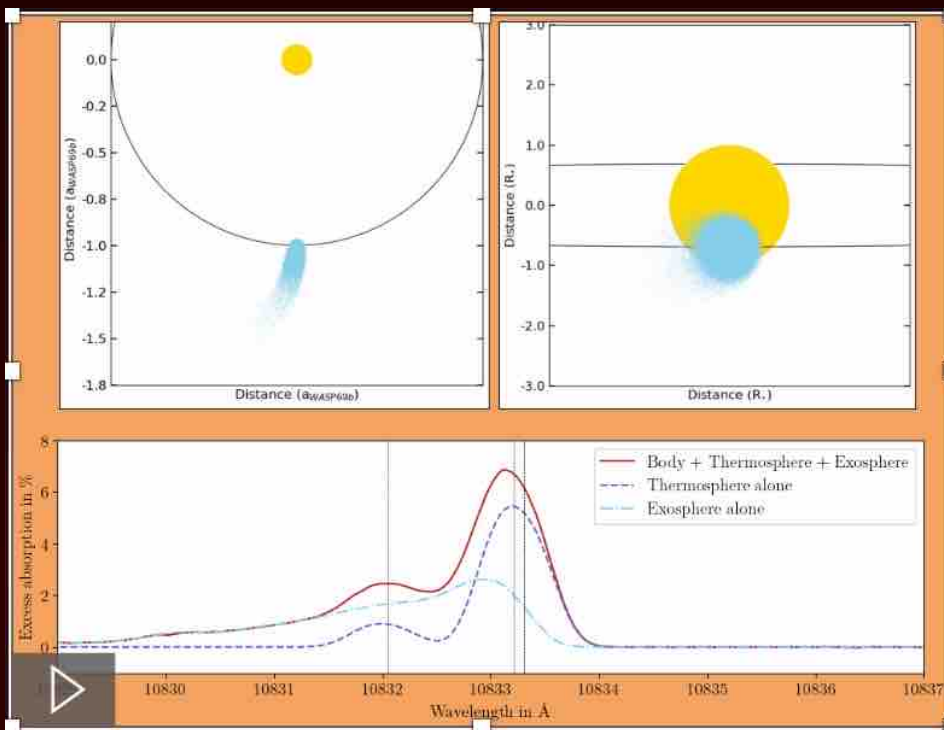

# 1D THERMOSPHERE INTO 3D FRAMEWORK

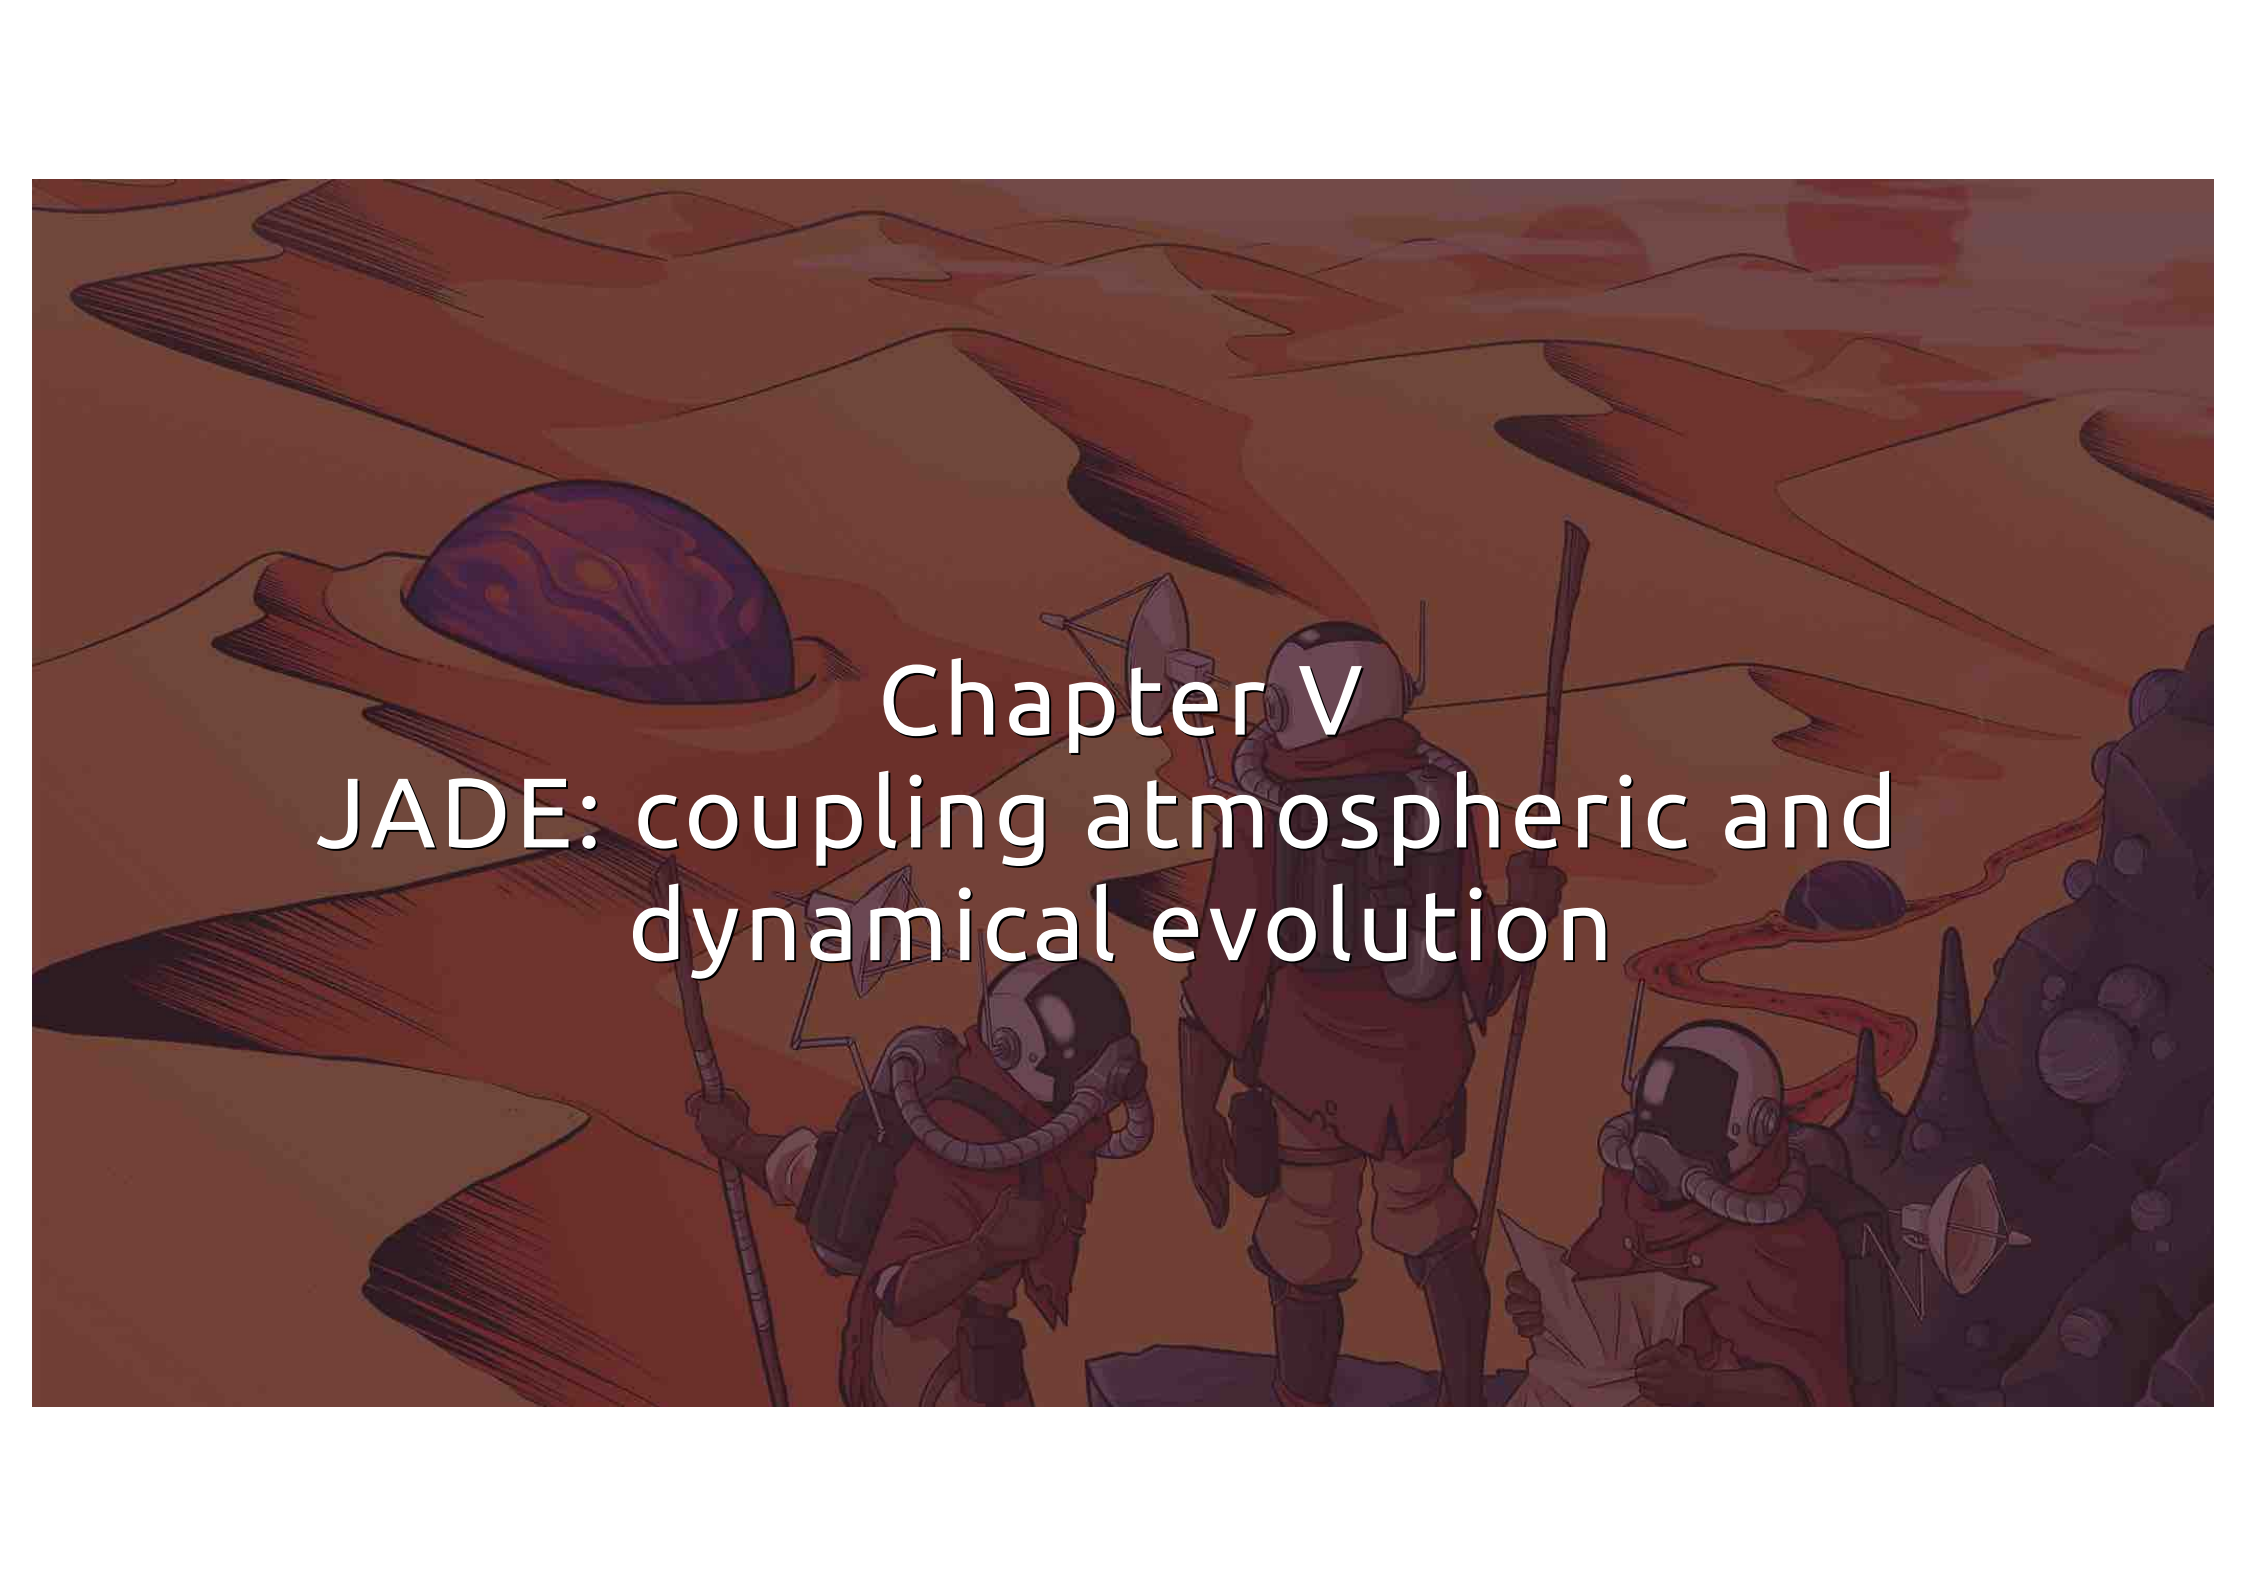

Use of *EVE* (Bourrier+2013, 2016) to constrain mass loss

- 3D code
- Spatially & spectrally-resolved stellar grid
- Thermosphere (1D p-winds profiles) coupled with exosphere (update by Y. Jaziri)
- Simulates spectra as observed with instruments

Preliminary simulation by Y. Carteret

An illustration of three astronauts in red spacesuits on a red planet. One astronaut is standing in the center, another is kneeling on the right holding a map, and a third is on the left. A satellite dish is visible on the ground. In the background, there is a crater with a purple and blue planet inside it. The text "Chapter V" and "JADE: coupling atmospheric and dynamical evolution" is overlaid in white.

Chapter V  
JADE: coupling atmospheric and  
dynamical evolution

# ORIGINS OF THE DESERT

Rocky planets  
Neptunes  
Jupiters

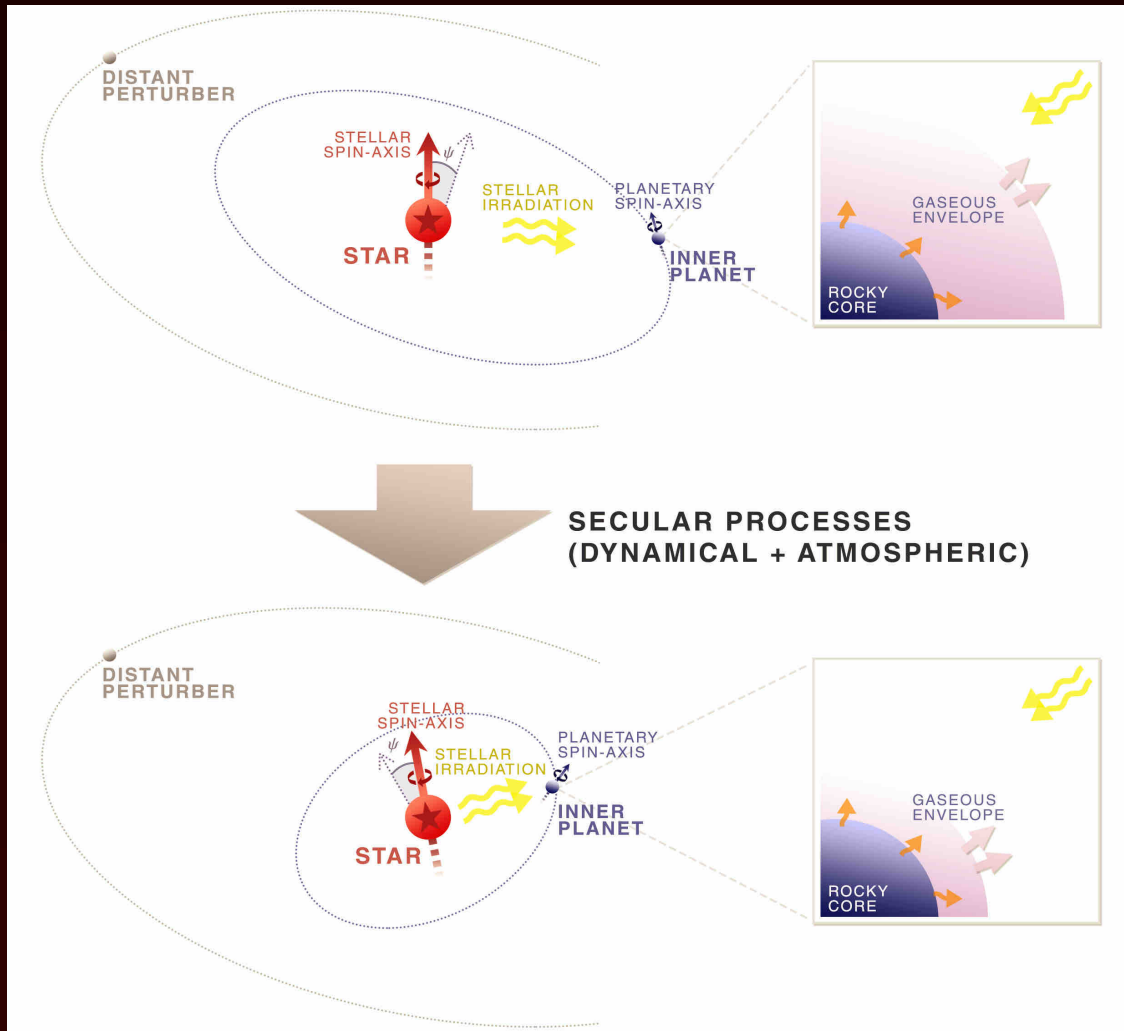

Disk-driven migration and early-on evaporation may not be dominant processes

High-eccentricity migration could delay the evaporation of a fraction of Neptunes

Need for orbital architecture & mass loss measurements to inform evolutionary models

# THE JADE CODE

3D dynamical evolution of an evaporating planet at high precision over secular timescales

Attia+2021

| Dynamics   | Atmosphere  | Star   |
|--|---|--|
| <ul style="list-style-type: none"> <li>• Outer perturber</li> <li>• Tidal effects</li> <li>• General relativity</li> </ul> | <ul style="list-style-type: none"> <li>• 1D structure</li> <li>• Photo-evaporation</li> <li>• Internal heating</li> </ul> | <ul style="list-style-type: none"> <li>• Evolving irradiation</li> <li>• Evolving spin</li> <li>• Contraction</li> </ul> |

# GJ436B: FLAGSHIP APPLICATION

Eccentric orbit despite advanced age (e.g. Butler+2006, Torres+2008, Lanotte+2014)

Highly misaligned orbit (e.g. Bourrier+2021)

Strong evaporation (e.g. Kulow+2014, Ehrenreich+2015, Lavie+2017, dos Santos+2019)

Inner edge of the desert

**How did it survive?**

# GJ436B: FLAGSHIP APPLICATION

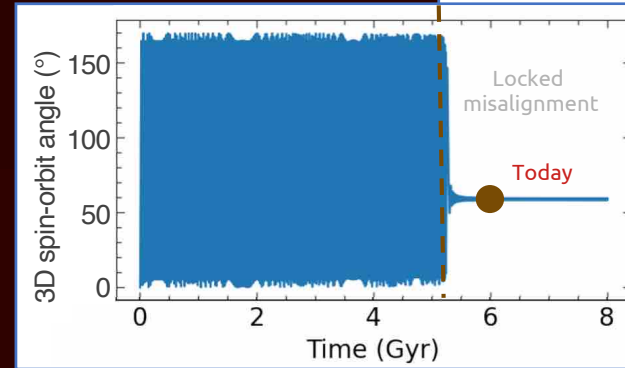

Spin-orbit angle measurements

Mass-loss rate measurements

JADE

Attia+2021

# Epilogue

# THE ATREIDES PROGRAM

## Ancestry, Traits, and Relations of Exoplanets Inhabiting the Desert Edges and Savannah

- Large program on VLT/ESPRESSO: 60 planet transits in 330 h over 2+ years
- Mini-GTO : ~60 collaborators (PI V. Bourrier, Observation managers M. Steiner & Erik Fridén)
- Transit spectroscopy goals: Building spin-orbit angle distribution of Neptunes over Desert and Savannah  
Probing planetary and stellar atmospheres

Major collaboration with NGTS

- Complemented by MUsCAT2, EulerCAM, STELLA
- Transit photometry for precise ephemeris
- Long-term photometry for rotation periods and activity

# DREAMING ON...

Simulating eroding rocky cores

JADE

High-eccentricity migration in population synthesis

SPICE DUNE

- What fraction of warm Neptunes underwent early / late migration ?
- How did it impact their atmospheric erosion ?
- What are the evolutionary links between planets around the desert ?

# WAKING UP MESSAGES

- Desert and Savannah encode information about evolutionary processes
- Helium signals trace atmospheric erosion but require finer interpretations
- Tides play a major role in shaping the architectures of close-in planets
- High-eccentricity migration may populate the rim of the desert
- Coupled atmospheric/dynamical simulations informed by samples of mass loss + spin-orbit angles are needed to decode exo-Neptunes origins
